This book constitutes the refereed proceedings of the 25th International Conference on Logic Programming, ICLP 2009, held in Pasadena, CA, USA, in July 2009. The 29 revised full papers together with 9 short papers, 4 invited talks, 4 invited tutorials, and the abstracts of 18 doctoral consortium articles were carefully reviewed and selected from 69 initial submissions. The papers cover all issues of current research in logic programming, namely semantic foundations, formalisms, nonmonotonic reasoning, knowledge representation, compilation, memory management, virtual machines, parallelism, program analysis, program transformation, validation and verification, debugging, profiling, concurrency, objects, coordination, mobility, higher order, types, modes, programming techniques, abductive logic programming, answer set programming, constraint logic programming, inductive logic programming, alternative inference engines and mechanisms, deductive databases, data integration, software engineering, natural language, web tools, internet agents, artificial intelligence, bioinformatics.

This book provides a comprehensive review of the works in the rapidly evolving field of neural networks and brain studies. Its purpose is two-fold: to help physicists entering this field to get a broader view of the context of the domain, and to help scientists of other disciplines to reach a better understanding of the physicists' contributions within a context of perspectives they can relate to. Included in the volume are 68 carefully selected, high quality reprints to provide the volume with both breadth and depth. It is organized into 5 sections and 22 chapters, both the sections and chapters being preceded by introductory comments by the editors.

Physical Biology of the Cell is a textbook for a first course in physical biology or biophysics for undergraduate or graduate students. It maps the huge and complex landscape of cell and molecular biology from the distinct perspective of physical biology. As a key organizing principle, the proximity of topics is based on the physical concepts that

book raises and tackles a number of important questions about the future and the lessons we can learn for the present.

Power Laws, Scale-free Networks and Genome Biology deals with crucial aspects of the theoretical foundations of systems biology, namely power law distributions and scale-free networks which have emerged as the hallmarks of biological organization in the post-genomic era. The chapters in the book not only describe the interesting mathematical properties of biological networks but moves beyond phenomenology, toward models of evolution capable of explaining the emergence of these features. The collection of chapters, contributed by both physicists and biologists, strives to address the problems in this field in a rigorous but not excessively mathematical manner and to represent different viewpoints, which is crucial in this emerging discipline. Each chapter includes, in addition to technical descriptions of properties of biological networks and evolutionary models, a more general and accessible introduction to the respective problems. Most chapters emphasize the potential of theoretical systems biology for discovery of new biological phenomena.

A fascinating look at near-future advances, inventions, products, services, and everyday conveniences that will change how we live and work. Marvin Cetron and Owen Davies explore these changes and the impact they will have on everyday life. For example, by the year 2010: -Personal computers will offer the power of today's supermachines and artificial intelligence. -A telecommunications network will supply the world with services from the contents of the Library of Congress to pornographic videos in Cantonese. -The United States-reversing a decades-old trend-will link its major cities with high-speed railroads. -Airplanes will be capable of leaping halfway around the world in just two hours. -Consumer goods will be produced at prices so low the poor of tomorrow could live as well as the rich of today. -Scientists will have learned to purge the air of pollution, closing up the Antarctic ozone hole and ending the threat of global warming. -Heavy industries can move into space, so that Earth can recover from our past environmental follies. -Dramatic advances in gene mapping and organ transplants will extend the healthy human life span well beyond the century mark. Science and technology have dominated life in developed countries since the Industrial Revolution. In the twenty-first century, they will change it almost beyond recognition. Probable Tomorrows tells us how.

"This book comprises a collection of authors' individual approaches to the relationship between nature, science, and art created with the use of computers, discussing issues related to the use of visual language in communication about biologically-inspired scientific data, visual literacy in science, and application of practitioner's approach"--Provided by publisher.
