introduction to the field of geochemistry. The book first lays out the ' geochemical toolbox ' : the basic principles and techniques of modern geochemistry, beginning with a review of thermodynamics and kinetics as they apply to the Earth and its environs. These basic concepts are then applied to understanding

behavior of trace

magmatic systems.  
Subsequent chapters  
introduce radiogenic and

geochemistry and  
illustrate their application  
to such diverse topics as  
determining geologic  
time, ancient climates,  
and the diets of

prehistoric peoples. The focus then broadens to the formation of the solar system, the Earth, and the elements themselves.

Then the composition of the Earth itself becomes the topic, examining the composition of the core, the mantle, and the crust and exploring how this structure originated. A final chapter covers organic chemistry,

discusses several didactic traditions in mathematics education in countries across Europe, including France, the Netherlands, Italy, Germany, the Czech and Slovakian Republics, and the Scandinavian states. It shows that while they all share common features both in the practice of learning and teaching at school and in research

and development, they each have special features due to specific historical and cultural developments. The book also presents interesting historical facts about these didactic traditions, the theories and examples developed in these countries.

usually discuss why they wrote it. We hope, however, that the text will justify itself. In fact, any well-trained ecologist will immediately grasp the significance of these seminal works. We have therefore tried to keep our interpretive comments to a minimum. Students of "modern" theoretical ecology will want to

We believe that those who do so will be surprised, if not amazed, by the ecological sophistication and intellectual power of the earlier works. They will stand as a challenge to those who study them, and we hope, provide a standard for the quality of their work. By
