English is an Indo-European language and belongs to the West Germanic group of the Germanic languages. Old English originated from a Germanic tribal and linguistic continuum along the Frisian North Sea coast, whose languages gradually evolved into the Anglic languages in the British Isles, and into the Frisian languages and Low German/Low Saxon on the continent.

Basic English is an English-based controlled language created by linguist and philosopher Charles Kay Ogden as an international auxiliary language, and as an aid for teaching English as a second language. Basic English is, in essence, a simplified subset of regular English. It was presented in Ogden's book *Basic English: A General Introduction with Rules and Grammar* (1930).

Language model adaptation is a standard method to enable the application of a language model to a new task; however, this approach is not able to deal with the issue of out-of-vocabulary proper names that appear in a task-dependent fashion. In this paper we attempt to solve this issue using a hierarchical language model. In the hierarchical model we use two independent Markov models to ...

The theme of this Research Companion is 'connectivity and the global reach of electroacoustic music and sonic arts made with technology'. The possible scope of such a companion in the field of electronic music has changed radically over the last 30 years. The definitions of the field itself are now broader - there is no clear boundary between 'electronic music' and 'sound art'. Also, what was previously an apparently simple divide between 'art' and 'popular' practices is now not easy or helpful to make, and there is a rich cluster of streams of practice with many histories, including world music traditions. This leads in turn to a steady undermining of a primarily Euro-American enterprise in the second half of the twentieth century. Telecommunications technology, most importantly the development of the internet in the final years of the century, has made materials, practices and experiences ubiquitous and apparently universally available - though some contributions to this volume reassert the influence and importance of local cultural practice. Research in this field is now increasingly multi-disciplinary. Technological developments are embedded in practices which may be musical, social, individual and collective. The contributors to this companion embrace technological, scientific, aesthetic, historical and social approaches and a host of hybrids – but, most importantly, they try to show how these join up. Thus the

intention has been to allow a wide variety of new practices to have voice – unified through ideas of 'reaching out' and 'connecting together' – and in effect showing that there is emerging a different kind of 'global music'.

The question of characterizing academic vocabulary has often been framed in a context that is purely determined by questions of language teaching. The aim in such approaches is to come up with a list of words for learners of English for Special Purposes. This book approaches this question from a more general, empirical perspective, focusing on medical vocabulary. Its main contention is that the characterization of medical vocabulary is much more complex than is suggested by a simple list. In a list, a threshold determines the borderline on a one-dimensional scale between what counts as medical vocabulary and what fails to qualify as such. In analysing how such lists have been produced and how the cut-off point has been determined, the book shows a number of factors that have to be taken into account. It uses a comparison of two corpora to demonstrate the extent to which text type determines the outcome of frequency calculations. On the basis of such observations, it argues for a new methodology for the calculation of the degree of “medicalness” of lexemes.

An introduction to some of the basic principles of linguistic analysis and a helpful manual for vocabulary discernment and enrichment.

This book presents the latest findings in the areas of data management and smart computing, machine

learning, big data management, artificial intelligence, and data analytics, along with advances in network technologies. The book is a collection of peer-reviewed research papers presented at Fifth International Conference on Data Management, Analytics and Innovation (ICDMAI 2021), held during January 15–17, 2021, in a virtual mode. It addresses state-of-the-art topics and discusses challenges and solutions for future development. Gathering original, unpublished contributions by scientists from around the globe, the book is mainly intended for a professional audience of researchers and practitioners in academia and industry.

A research paper or graduate essay demonstrating weak English and poor formatting is likely to be rejected by an editor or marked down by an assessor; but why should these gaps in your English knowledge undermine your subject knowledge and skill as an engineer or student of the discipline? *Written English: A Guide for Electrical and Electronic Students and Engineers* is the first resource to work at the sentence level to resolve the English language problems facing international engineering students and scholars. Informed by hundreds of research papers and student essays, this valuable reference: Covers grammar essentials and key terms in the fields of electrical engineering, electronic engineering, and communication systems Uses real-world examples to reveal common mistakes and identify critical areas of focus Provides practical solutions to formatting, vocabulary, and stylistic issues *Written English: A Guide for Electrical and Electronic Students and Engineers* equips readers with the necessary knowledge to produce accurate and effective English when writing for engineering.

This is a must read book by Stephen Gislason who simplifies complex issues and introduces new and sometimes surprising insights. Click the topics (left) to read from the book. From the introduction. "Humans resemble other animals in their ability to communicate. Communications involve chemical senses, sounds, body language, and visual signals. Communication is all about community, sharing information, sending warning signals and fulfilling the needs of the group. Human languages combine many different expressions of communication in a complex manner. Ideas about written language tend to dominate scholarly investigations, but sounds and gestures have been more important in the evolution of communication systems. Speaking is a spontaneous feature of the brain, and all normal children will speak if they hear a language spoken; any language will do. Older infants imitate words they hear spoken and if adults engage them in conversation, will expand their vocabularies and start to make meaningful statements; Words go with gestures Young children point with a pudgy index finger and say the name their pointer indicates. Pointing and naming remains an endearing characteristic for the rest of a human life. Babies follow the path of language evolution. Their progress is from the description of the immediate and concrete objects to making abstract statements about events; The first thing you do when you are learning a language is point and name. You invent nouns. Little tykes can get a lot accomplished with their pointing finger and a few nouns. Tourists in a foreign country revert to the two-year-old strategy of pointing, naming, using pantomime to replace the verbs they do not know;" One of the most important and least recognized features of the human mind is selftalk. In adults, selftalk is described as "thinking" or "reflection." Aristotle declared that thinking was "inner speech" and he defined the rules of logic, the proper methods of constructing relationships among statements. Selftalk is a continuous

narrative feature of the mind. Through selftalk, language becomes a dominant feature of cognition. Narrative dominance enables some of the best cognitive abilities that humans display, but narrative dominance can also be disabling; The recognition that selftalk is thought resolves tedious debates about the relationship of language to cognition. It is no longer necessary to argue that the structure and content of languages influence thinking. Language is thinking.

This book offers a highly accessible introduction to natural language processing, the field that supports a variety of language technologies, from predictive text and email filtering to automatic summarization and translation. With it, you'll learn how to write Python programs that work with large collections of unstructured text. You'll access richly annotated datasets using a comprehensive range of linguistic data structures, and you'll understand the main algorithms for analyzing the content and structure of written communication. Packed with examples and exercises, *Natural Language Processing with Python* will help you: Extract information from unstructured text, either to guess the topic or identify "named entities" Analyze linguistic structure in text, including parsing and semantic analysis Access popular linguistic databases, including WordNet and treebanks Integrate techniques drawn from fields as diverse as linguistics and artificial intelligence This book will help you gain practical skills in natural language processing using the Python programming language and the Natural Language Toolkit (NLTK) open source library. If you're interested in developing web applications, analyzing multilingual news sources, or documenting endangered languages -- or if you're simply curious to have a programmer's perspective on how human language works -- you'll find *Natural Language Processing with Python* both fascinating and immensely useful.
