This is a practical field manual for the identification of the 500 genera of native and naturalized Malagasy trees. Identification keys emphasise vegetative and gross morphological features. All genera are provided with full descriptions, distribution information, key characteristics, up-to-date taxonomic references and over 3,000 Malagasy vernacular names and almost all are illustrated. This is the first comprehensive guide to be published in both English and French.

Over the past several decades, the U.S. cityscape has changed radically. Large areas have been cleared of natural vegetation to accommodate new development. The "urban forest," which consists of all city trees, natural and planted, has been severely and negatively impacted. A 2003 study indicates that we are losing through clearing and grading four trees for every one planted. This is a wake-up call for greatly increased planting in the urban forest and the need to popularize small trees (defined as trees that grow up to thirty feet high) for diminished city spaces. Small Trees for the Tropical Landscape describes and illustrates 129 species and subspecies and 48 named varieties, cultivars, and forms plus 23 hybrids appropriate for the home garden and confined public landscape spaces. The authors have also included a section on "Tailored Small Trees," large shrubs that are readily transformed into small trees through intelligent, selective pruning. They identify and describe 67 species and subspecies; 40 named varieties, cultivars, and forms; and 21 hybrids that are appropriate for this conversion. Several appendices will assist the gardener with tree selection for specific purposes (screens and windbreaks, coastal gardens, edible fruit, and colorful flowers and foliage). Species that may cause skin irritation or that are poisonous are identified in the text as are those trees with the ability to fix nitrogen. The authors also warn against planting a number of species known to be invasive in Hawai'i and advise caution when planting others that have the potential to escape cultivation and become weeds.

This fourth edition of Plant Systematics is completely revised and updated. It incorporates the updated International Code of Nomenclature for Algae, Fungi and Plants (Shenzhen Code, 2018), the new version of PhyloCode (Beta version of Phylocode 5, 2014), APweb version 14 (September, 2018), revised Angiosperm Phylogeny Group classification (APG IV, 2016), new Pteridophyte Phylogeny Group Classification (PPG I, 2016), besides the updates since the publication of third edition. The book is a blend of classical fundamental aspects and recent developments, especially in the field of molecular systematics, cladistics and computer identification. Special attention has been given to information on botanical nomenclature, identification, molecular systematics and phylogeny of angiosperms. The complicated concepts of phylogeny, taxometrics and cladistics have been explained with a view to providing a comparison between these diverse but interactive fields of study. An attempt has been made to build upon a common example when exploring different methods, especially in procedures of identification, taxometrics and cladistics. The major systems of classification are evaluated critically. Discussion on major families of Pteridophytes, Gymnosperms and Angiosperms, especially those of major phylogenetic interest, form a major portion of this edition. The ebook includes nearly 500 color photographs set out in 36 pages covering plants from different parts of the world. In addition, 305 black & white illustrations have been included to provide a better understanding of the plants covered in the book.

This is the only comprehensive account of all eight species in the genus Adansonia. It describes the historical background from the late Roman period to the present. It covers the extraordinary variety of economic uses of baobabs. There are also appendices on vernacular names, gazetteer, economics, nutrition and forest mensuration. This book fills a gap in the botanical literature. It deals with a genus that has fascinated and intrigued scientists and lay persons for centuries.

The focus of the present edition has been to further consolidate the information on the principles of plant systematic, include detailed discussion on all major systems of classification, and significantly, also include discussion on the selected families of vascular plants, without sacrificing the discussion on basic principles. The families included for discussion are largely those which have wide representation, as also those that are less known but significant in evaluating the phylogeny of angiosperms. The discussion of the families also has a considerable focus on their phylogenetic relationships, as evidenced by recent cladistic studies, with liberal citation of molecular data. Several additional families have been included for detailed discussion in the present volume.
