The pretreatment of a sample prior to analysis is a vital part of any analytical measurement, whatever technique is subsequently applied. This book emphasizes the critical nature of these operations and covers all the important procedures of sample pretreatment. Chapters cover the analytical sequence, preliminary sample treatment, decomposition and dissolution of inorganic solids, decomposition of organic and biological matrices for elemental analysis, organic derivatives in analysis, metal-complex formation in analysis, separation and preconcentration techniques, solvent extraction, ion exchange, and other separation techniques. Includes self-assessment questions and responses, and units of measurement.

Raw samples taken for chemical analysis are unlikely to be tested in their original form. Virtually every analytical procedure calls for the sample to be pre-treated in some way. At the simplest level this may involve dissolution prior to some spectrophotometric reading; at its most complex it may involve conducting various complex extractions and derivative stages.
